User Documentation V3

EasySave - Groupe 6

Clément COURTEMBERT-GAILLARD / Maxime FERREIRA / Mathéo BERGER / Elouan JEANNOT

CESI A3

In this documentation, you will find all the information necessary for the correct operation of version 3.0 of our software EasySave.

For the English execution of the program, at application startup, you have automatically English language, you can switch to French if you want and go back to English.

When the application is started, the execution page of a save work is displayed where it is possible to start the execution of a save work or a sequential execution of the save works. While running, the state file is created and refreshes in real time, you can see its contents in a pop-up that appears at the same time as the backup. At the end of this, the log file is updated with the new save executed.

During the first start of the software, you will not have any save work, so you will have to create them by going through the menu «Configuration», then «Create a save work», then you will have to fill out the form and validate.

When creating a save work, it is possible to check a box at the end to encrypt the files with the chosen extensions.

In the configuration tool, the user must, if he has any, inform his business software so that the application can take the latter into account. He can also define file extensions of files to encrypt, the maximum file size allowed for simultaneous transfers as well as the file extensions to be copied as a priority during a backup job.

The execution of a backup job will be stopped if the user has chosen a business software seen previously. The application designed to forbid backup if any of this software is detected.

If it is possible to create a save work, it is also possible to delete it, if it no longer seems useful to you or if you made a mistake while creating it.

If the save work fails, the application will notify the user and return him to the choice of the backup to perform. Conversely, if it is done correctly, and depending on the number of backup jobs remaining to run, the application will continue to perform the backups, either until a problem occurs in the execution of one of the save works, or until none remains. In addition, it is possible to pause, resume or stop saveworks.

You can also choose to see the log or state file via the "Logs" menu and then "Log file" or "State file". Whatever it chooses, the file in question will be opened in the default Windows notepad.

A remote console is also available in order to be able to monitor the status of backups in real time remotely, as well as to interact with them.

A "About us" section has been added so you can learn more about us and our EasySave backup software.

Finally, the option to exit the application is available through the menu.
